                                                                                                                                                                                                                                                                                                                CC polypertide (II) sequences. (I) is useful as hybridisation probes, CC polypertide (II) sequences. (I) is useful as hybridisation probes, CC polypurase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC quantifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or GC quantifiating a polypeptide in tissue, as molecular weight markers and as CC afood supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics forensics, gene mapping, identification of mutations (CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO at the first of the invention of the printed contains and contains of the invention.
                                                                                                                                                                                                                Š
                                                                                                                                         밁

The invention relates to isolated polynucleotide (I) and collective (II) sequences. (I) is useful as hybridisation probes, cc polymerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags (C for identifying expressed genes. (I) is useful in gene therapy techniques (C II). (II) is useful for generating antibodies against it, detecting or cc quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical collingual colling
                                                                                                                                                                                        RESULT 15

                                                                                                         δÃ
                                                                                                                                                                                                                                                                          The present invention describes a library of human polynucleotides CC comprising the sequences given in AAZI2532 to AAZI779. Also described is CC a method of detecting differentially expressed genes correlated with the CC cancerous state of a mammalian cell, comprising detecting at least one CC differentially expressed gene product in a test sample from a cell course of the 5248 polynucleotide sequences given in AAZI2532 to AAZI779. The CC polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, cmapping, tissue typing or profiling, forensics, genetic analysis and CC detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and CC therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to detection of an CC arrays for diagnostics (which may be used to detection of an CC identify a genetic predisposition or susceptibility to a disease such as CC cancer). The polynucleotides of the invention are especially used in the CC diagnosis, prognosis and management of colorectal cancer, breast cancer, cand lung cancer. The polynucleotides can also be used to screen for nentify and antarophets
                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Crkvenjakov R, Dickson M, Drmanac R, Drmanac S;

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                 57.2

Second strand was primed with a BamHl dC primer [5'AGAGAGCTCGGATCCGCGCGCAATAATAATAAT(C) 3'].
Double-stranded cDNA was then digested with BamHl and XhoI and directionally cloned into the BamHl and SalI sites of lambda pSB vector. Library went through one round of normalization. Library was constructed by Wei Yu at RIKEN of Japan (Carninci P, Westover A, Nishiyama Y, Ohsumi T, Itoh M, Nagaoka S, SasakiN, Okazaki Y, Muramatsu M, Schneider C, Hayashizaki Y, High efficiency selection of full-length cDNA by improved biotinylated cap trapper., 71 a 208 c 137 g 67 t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note-"Vector: Lambda pSB; Site_1: BamHI; Site_2: EcoRI;
/first strand cDNA was primed with an anchored
XhoI-oligo(dT) primer [5'GGACGACTGGACGGCCGCAGGAGGAG(T)VN
3'; V-A,C,G; N-A,C,G,T] and then dG tailed. Second strand
was primed with a BamHI-dC primer
[5'ARAGACTCGAGTCCGCGCGCAATAATAATAATAATC)
Double-stranded cDNA was then digested with BamHI and XhoI
and directionally cloned into the BamHI ard SalI sites of
lambda pSB vector. Library went through one round of
normalization. Library was constructed by Mei Yu at RIKEN
of Japan (Carninci P, Mestover A, Nishiyama Y, Ohsumi T,
Itoh M, Nagacka S, SasakiN, Okazaki Y, Muramatsu M,
Schneider C, Hayashizaki Y, High efficiency selection of
full-length cDNA by improved biotinylated cap trapper.,
DNA Res 4: 1, 61-6, Feb 28, 1997)*

Determination of this BAC-end sequence was carried out as part of collaboration with the European Drosophila Genome Project (EDGP)
http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC
library (Dros BAC) was made by Alain Billaud at CEPH (Centre
d'Etude du Polymorphisme Humain) with funding provided by a MRC
project grant. The DNA was prepared from embryos by Alain Bucheton
and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (02-AUG-2001) Asso Fujiyama, The Institute of Physical and Chemical Research (RIKEN), Genomic Sciences Center (GSC); 1-7-22 Subhiro-chou, Tsutumi-ku, Yokohama, Kanagawa 230-0045, Japan (E-mail:chimpbes@gsc.riken.go.jp, URL:http://hgp.gsc.riken.go.jp/, Tel:81-45-503-911, Fax:81-45-503-9170) Tel:81-45-503-911, Fax:81-45-503-9170) Tel:81-45-603-9110, Fax:81-45-503-9170) Tel:81-45-503-9170) Tel:81-45-503-9170 Fax:81-45-503-9170 Fax:81-45-50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients affilted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression or of a hAMP, and determine regression, progression or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (MN) Group 1 molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, leimyosarcoma or synovial sarcoma. The present sequence is a small cell lung cancer associated gene designated as NY-SCIC-11, encoding human KIAA0953 protein.

Human ORFX ORF1553 polynucleotide sequence SEQ ID NO:3105

φ 40 40 40

```
A AAC74446 to AAC75606 encode the proteins given in AAB40237 to AAB43397.

CC which represent the human ORRX open reading frames 1 to 3161. The ORRX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary: CC antiparchic; antiparkinsonian; nontropic; neuroprotective; costeopathic; anticorvulsant; antiarthritic; immunosuppressant; costeopathic; anticorvulsant; antiarthritic; immunosuppressant; cantiduction; vanibacterial; antiviral; antifungal; antirhordic; antiproid; and antianemic. The sequences can be used for determining the prosence of or predisposition to, or preventing or treating conditions associated with an OREX-associated disorder. The presence of or predisposition to, or preventing or treat concers, pathological conditions associated with an OREX-associated disorder. The concisis acids can be used to express OREX proceins in gene therapy concisis acids can be used to express OREX proceins in gene therapy are proteins and nucleic acids may be used to treat concers, proliferative disorders, neurodegenerative disorders, osteoarthritis, concisis and the proteins and nucleic acids may be used to treat concers, proliferative disorders, neurodegenerative disorders, osteoarthritis, concisis and proteins and nucleic acids may be used to treat concers, proliferative disorders, osteoarthritis, concerns and proteins and nucleic acids may be used to treat concerns, concisis and proteins and associated disorders, asthma, concerns and properly and associated antipage, antimal, antinflammatory disease; to enhance constitute, and as a contraceptive.

The present sequence is one of a large number of 5' ESTs derived from mRNAS encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA

Claim 1; SEQ ID 19721; 71pp + CD-ROM; English.

diagnostic, forensic, gene therapy and chromosome mapping procedures New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and fo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   17-JAN-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200155367-A1

The invention relates to novel genes (AAL34669-AAL37666) and proteins (AAB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, other cancers e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Croh's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Croh's disease, (c) cardiovascular disorders such as myocardial isohaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17-NOV-2000;

AAA00010 to AAA02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of pre-metastatic or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, cestrogen receptor-positive breast cancer, cestrogen receptor-

```
CA AAA00010 to AAA02716 represent polynucleotides isolated from cDNA CC libraries constructed from human colon cancer cell lines. The present CC invention also describes a method of detecting differentially expressed CC genes correlated with a cancerous state of a mammalian cell, comprising CC detecting at least one differentially expressed gene product in a test CC sample derived from a cell suspected of being cancerous, where detection CC concerous state of the cell from which the test sample was derived. CC cancerous state of the cell from which the test sample was derived. CC differentially expressed genes correlated with a cancerous state of a CC cancerous of the cell from which the test sample was derived. CC detecting and mapping related genes correlated with a cancerous state of a CC cancerous of diseases and disorders (e.g. identification of corresponsiveness of cancer to therapy). This is particularly for breast CC cancer, coestrogen receptor-positive breast cancer, coestrogen receptor-positive breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plasmid pCMVEBNA. EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orip) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy, for one amplification. Cell immortalization.

```
protein), a nucleic acid encoding an RNA that is not intended to be translated (e.g. a therapeutic RNA), or a DNA sequence used as a tag for the cells. The method is applicable to cell culture or intact organisms, for gene therapy. It allows the rapid establishment of eukaryotic cells that stably and reliably express a gene of interest, using a novel method of selection, and maintenance of that selection without the need for exogenous
                                                                                                                                                                                                                                                                            and the selective pressure specified by the marker is maintained. Under these conditions, only cells containing both episomes live. Preferably, EBNA1 is expressed from 1 of the episomes, and the protein of interest from the other episome. Either or both epitopes may further comprise a nucleic acid sequence encoding a protein desired to be expressed in the cell (e.g. a therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                   comprising an BBV orip and a gene encoding a second protein, where expression of the second protein prohibits the occurrence of cell death resulting from expression of the first protein to produce doubly transfected cells which also express an antigen that promotes retention of the episomes by the cells. The doubly transfected cells are maintained under conditions in which the first and second proteins and the selectable marker are expressed, first and second proteins and the selectable marker are expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of DNA encoding the Epstein-Barr virus (EBV) nuclear antigen protein 1 (EBNA1, see AAY95856). EBNA1 is utilised in a novel method for obtaining a eukaryotic cell that is stably transfected with at least one episome. This method involves transfecting a eukaryotic cell with: (1) a first episome comprising an EBV origin of replication (oriP, see AAA50253), a gene encoding a first protein whose expression results in cell death and a selectable marker for antermore action.
                                                    selection factors, such as antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Fig 2; 53pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides a composition comprising nucleic acid, histone HI protein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the tethering protein is LANA. The composition is useful in aiding the retention of the viral DNA in the host call. The viral vector encodes a protein suitable for tethering DNA to Histone HI. Methods for screening for compounds which are agonistic or antagonistic for the tethering of viral proteins to histone HI and DNA binding sites are useful for developing the method of viral transfer. The composition has applications to gene therapy, including the treatment of multiple sclerosis, Parkinson's disease, Huntington disease and diabetes. The present sequence represents the nucleotide sequence of the Epstein-barr virus (EEV) tethering protein ENNAI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Histone H1; tethering protein; LANA; gene therapy; multiple sclerosis; Parkinson's disease; Huntington disease; diabetes; human herpesvirus ?

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents the Epstein Barr nuclear antigen. It is used to produce bait vectors of the invention. The specification describes a compositions and methods for a genetic system of detecting protein-protein interactions in a mammalian host cell. The system comprises bait and test, both containing selection genes, and viral origin of replications which require bound viral replication proteins to effect replication. The compositions is useful for detecting an interaction between a bait protein and a test protein. It is useful in a mammalian two-hybrid system for detecting protein-protein interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for detecting protein-protein interactions in a mammalian two hybrid system comprises bait and test vector which consist of selection gene, vector viral origin of replication and fusion gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Origin of replication; protein-protein interaction; replication; two-hybrid system; nuclear antigen; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAA75454;
